Professional Summary

- Full-stack web developer with 5+ years of experience shipping production web applications in logistics, enterprise reporting, and Web3. Day-to-day work is React and TypeScript on the frontend with Java and PostgreSQL on the backend. I have taken products through micro-frontend migrations, built shared component libraries used across multiple modules, and handled real-time data, JWT/RBAC security, and test coverage. I use AI coding tools such as Cursor and Claude for prototyping, debugging, and documentation, and treat their output as a first draft to review rather than code to ship.

Core Skills

Frontend: React, Redux, TypeScript, JavaScript (ES6+), HTML5, CSS3, SCSS, Tailwind CSS, Material UI (MUI), Micro-Frontends, Webpack, Responsive Design

Backend: Java, REST API design, WebSockets (Socket.io), JWT Authentication, Role-Based Access Control (RBAC), Microservices

Databases: PostgreSQL, MongoDB, SQL, DBeaver

Testing: Jest, React Testing Library (RTL), Unit Testing, Integration Testing

Cloud & DevOps: Microsoft Azure, Docker, Git, GitHub, CI/CD workflows

Tools & Practices: Jira, Confluence, Figma, Postman, VS Code, Cursor AI, Claude AI, Agile / Scrum, Code Review

Professional Experience

ViitorCloud Technologies Pvt. Ltd. <i>(via Intech Creative Services)</i> <i>Software Engineer</i>	Jan 2024 – Present <i>Ahmedabad, India</i>
Logicrays Pvt. Ltd. <i>Full-Stack Web Developer</i>	Mar 2021 – Dec 2023 <i>Ahmedabad, India</i>
Twinio Tech Pvt. Ltd. <i>Frontend Web Developer</i>	Apr 2020 – Mar 2021 <i>Remote</i>

Key Projects

Dynamic Terminal System	Logistics & Terminal Operations Platform (2024 – Present)
- Built a multi-tenant, multi-site, multi-language platform that lets each terminal and facility run on its own configuration from a single codebase, currently serving 3 terminals. - Developed CANDI, a component-based React framework that renders screens from JSON configuration instead of hardcoded components. - Migrated the frontend to a micro-frontend architecture so each module builds and deploys independently, removing release coordination between module teams. - Built the shared UI library — dynamic grids, forms, input controls, and layout utilities — and rolled it out across modules, with 6 developers building on it. - Added filtering, sorting, pagination, column configuration, and persisted grid state so users keep their view between sessions. - Implemented role-based authentication and authorization so access is controlled per site and per user role. - Configured Webpack to output static HTML builds for deployment inside restricted, network-isolated terminal environments. Tech stack: React, PostgreSQL, Java, Microsoft Azure, Webpack, Micro-Frontends, NPM / Node v22	
Cerebital	Operational Data UI Platform (2024)
- Built the dashboard frontend with resizable panels, dynamic grids, and drag-and-drop for tabs and rows, so users could rearrange layouts around their own workflow. - Wrote the REST API in Node.js and Express using a routes / controllers / services structure, serving 18 endpoints to dashboards, Kanban boards, timelines, and analytics widgets.	

- Added real-time data sync over Socket.io and moved aggregation to the server, reducing dashboard load time by 20% on datasets of 80,000 rows.
- Integrated visualization widgets using Chart.js, Recharts, D3, Vis.js, React-Flow, and Three.js, and converted Figma designs into responsive SCSS layouts.
- Secured the API with JWT authentication, role-based access control, and Express middleware (helmet, express-rate-limit, express-validator) for CORS policies, rate limiting, and input validation.
- Wrote unit and integration tests with Jest, React Testing Library, and Supertest, reaching 98% coverage across components, API routes, and middleware.
- **Tech stack:** React, Node.js, Express, PostgreSQL, Socket.io, Redux, MUI, SCSS, JWT, Jest, Jira

Product Forecast Web App

Enterprise Forecasting & Reporting Dashboard (2023)

- Built a sales forecasting dashboard with Scatter, Line/Bar, Forecast, Sankey, and Network charts so teams could compare the same projection across different views.
- Implemented hierarchical role-based access so each sales role only saw data at or below their level in the org structure, supporting 5 role tiers.
- Added date, product-category, and multi-parameter filters to let users narrow a forecast down to a specific segment.
- Built Excel import and export so users could download forecast data, edit it offline, and upload revisions back into the app, replacing a manual process that took 2 hours per cycle.
- Delivered the app as micro-frontends so individual dashboard modules could be released independently.
- **Tech stack:** React, TypeScript, Redux, PostgreSQL, Micro-Frontends, Jira

Social Media Platform for NFT Holders

Web3 Community Application (2023)

- Built wallet-based login with MetaMask and Coinbase Wallet, replacing passwords with signature-based authentication.
- Added an interactive world map showing where other holders of the same collection were located.
- Built real-time chat so holders could message each other and discuss collections directly in the app.
- Built a posts and comments system where users publish their own NFTs with images and descriptions, and reply to other holders' posts.
- Integrated the Moralis NFT API to pull live sales, ownership, and price data for each token.
- **Tech stack:** Angular 13, Web3, Firebase, Moralis

Education

Darshan Institute of Engineering and Technology

Jul 2017 – Mar 2021

Bachelor of Engineering in Computer Engineering — CGPA: 8.2 / 10

Gujarat, India
